The core application file, **app.py**, relies on several key dependencies to function properly:

- **Internal package db - crucial for managing the data workflow:**
  - **db.load_data module** reads applicant data from a JSON file and loads it into the PostgreSQL database if the table is empty.
  - **db.query_data module** runs SQL queries to get applicant statistics for the web page.
- **Psycopg** connects the app to the PostgreSQL database, running SQL commands for both loading and querying data.
- **Flask** handles web requests, runs the data loading and querying, and renders the HTML page.
